1. INTRODUCTION

1.1 Project Overview

Predicting and diagnosing heart disease is the biggest challenge in the medical industry and it is based on factors like physical examination, symptoms and signs of the patient. Factors which influence heart diseases are cholesterol level of the body, smoking habit, and obesity, family history of diseases, blood pressure and working environment. Machine learning algorithms play a vital and accurate role in predicting heart disease. The advancement of technologies allows machine language to pair with big data tools to handle unstructured and exponentially growing data. The leading cause of death in the developed world is heart disease. Therefore, there needs to be work done to help prevent the risks of having a heart attack or stroke.

1.2 Purpose

The leading cause of death in the developed world is heart disease. Therefore, there needs to be work done to help prevent the risks of having a heart attack or stroke. Using the dataset to predict which patients are most likely to suffer from a heart disease in the near future using the features given.

2. LITERATURE SURVEY

2.1 Existing problem

A major challenge faced by health care organizations, such as hospitals and medical centers, is the provision of quality services at affordable costs.¹ The quality service implies diagnosing patients properly and administering effective treatments. The available heart disease database consists of both numerical and categorical data. Before further processing, cleaning and filtering are applied on these records in order to filter the irrelevant data from the database.² The proposed system can determine an exact hidden knowledge, ie, patterns and relationships associated with heart disease from a historical heart disease database. It can also answer the complex queries for diagnosing heart disease; therefore, it can be helpful to health care practitioners to make intelligent clinical decisions. Results showed that the proposed system has its unique potency in realizing the objectives of the defined mining goals.

2.3 Problem Statement Definition

Data analytics is considered as a cost effective technology in the recent past and it plays an essential role in healthcare which includes new research findings, emergency situations and outbreaks of disease. The use of analytics in healthcare improves care by facilitating preventive care and EDA is a vital step while analysing data.

3. IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

3.2 Ideation & Brainstorming

3

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

🕒 20 minutes

DATASET

The algorithm is capable of handling large dataset with high dimensionality.

We can get such large datasets from kaggle, Global Health Observatory Data Repository etc.

To handle large datasets we need a suitable algorithm with high efficiency.

ALGORITHM

Random forest algorithm the higher it's accuracy and problem solving ability.

Random forest as decision tree that takes the average to improve the accuracy of the dataset

It is based on the concept of ensemble learning which is process of combining multiple classifier to solve a complex problem

TOOLS

IBM Cognos Analytics integrates reporting, modeling, analysis, dashboards, so that you can understand your organization data, and make effective business decisions.

Colab to write and execute arbitrary python code through the browser, and is especially well suited to machine learning, data analysis and education.

For implementing the problem in python using the Random forest algorithm.

TIP

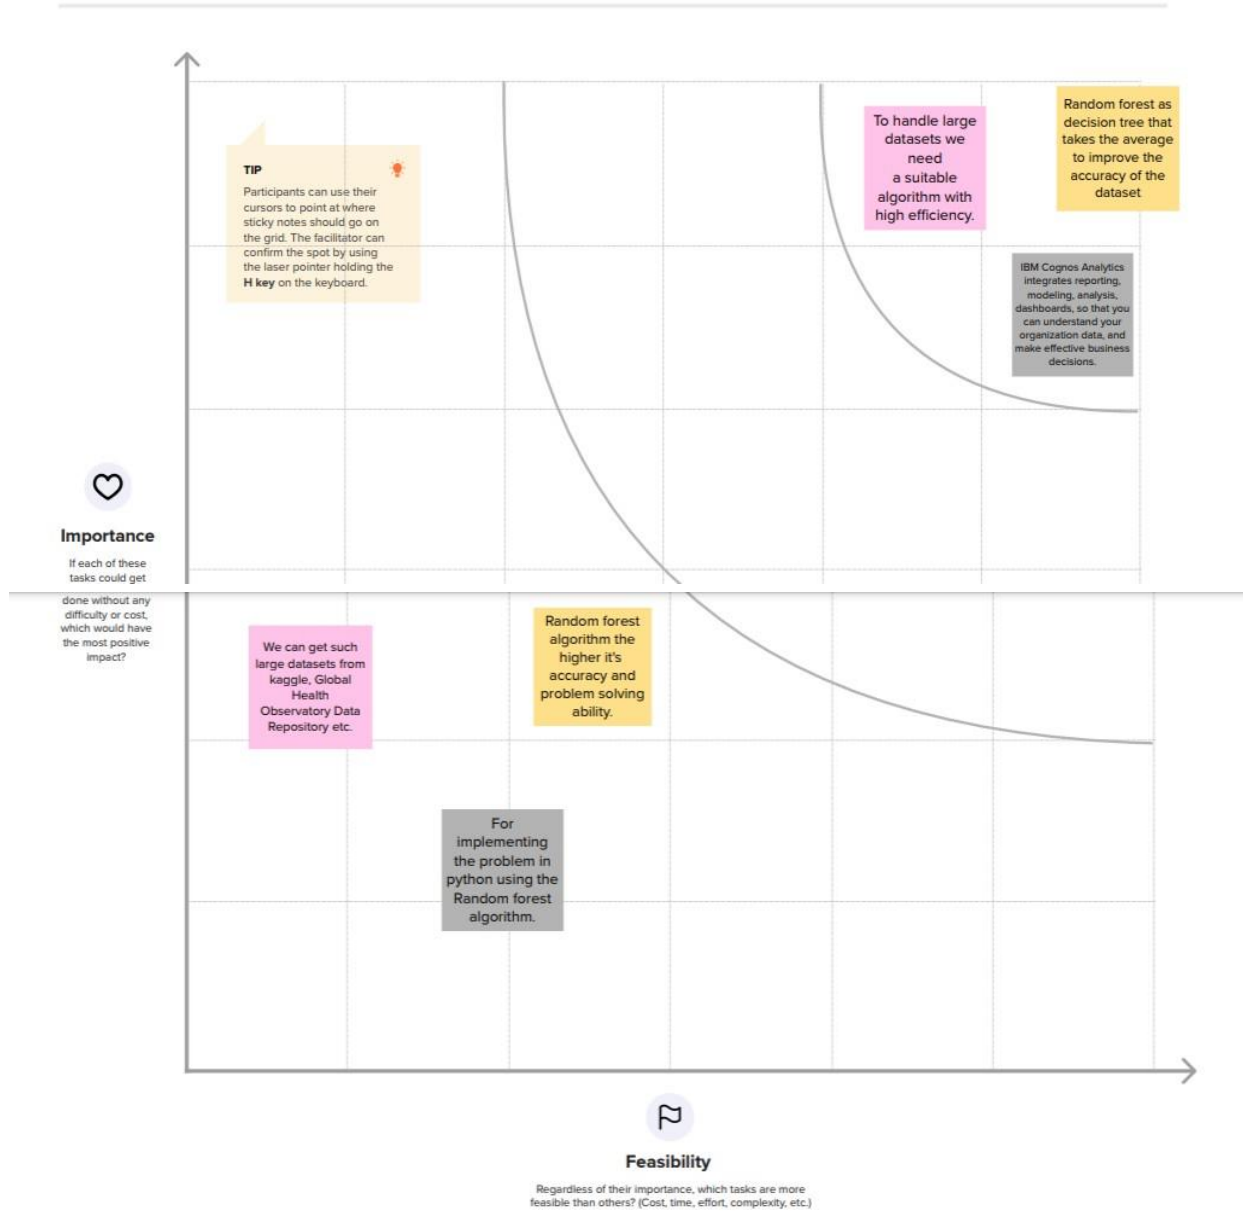

Add customizable tags to sticky notes to make it easier to find, browse, organize, and categorize important ideas as themes within your mural.

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

🕒 20 minutes

3.3 Proposed Solution

S.N o.	Parameter	Description
1.	Problem Statement (Problem to be solved)	1. To develop an interactive dashboard to predict the heart disease accurately with few tests and attributes the presence of heart disease.
2.	Idea / Solution description	1. Analyzing data and identifying the heart disease using Cognos analytics tools.
3.	Novelty / Uniqueness	1. Hoping to achieve maximum accuracy to provide prior treatment to the patients and reduce the fatality rate.
4.	Social Impact/ Customer Satisfaction	1. Saving lives, User friendly interactive dashboard. 2. Reduces the biases and mistakes caused by the decisions of doctors based on their intuitions and experiences.
5.	Business Model (Revenue Model)	1. Data security. 2. Easy to use. 3. Constant updates according to necessity.
6.	Scalability of the Solution	1. Can be used in any platform (Windows, mac, etc.,) 2. Adding new feature doesn't affect the performance of the system. 3. Scalable dataset.

3.4 Problem Solution fit

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS Who is your customer? i.e. working parents of 0-5 y.o. kids. People who suffer from heart disease.	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. Insufficient money for medical checkups. Unaware about regular checkup.	5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking Customers can go to the doctor for a medical checkup Based on the test results doctors will advice them. The patient can do manual prediction.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides. Visualizations give doctors very good insights on the potential chances for a patient to get heart disease. Visualizing and predicting heart disease.	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations. The main reason of getting chdr diabetics, high cholesterol and blood pressure, smoking, mental depression, eating an unhealthy diet and any family history of heart disease.	7. BEHAVIOUR What does your customer do to address the problem and get the job done? (i.e. Directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) First of all they(Customer or patients) should report what problem they are undergoing according to their health condition. After that they are instructed to follow the steps that the solution provider given(that is jobs to be done for curing their illness).	
Focus on J&P, tap into BE, understand RC	3. TRIGGERS TR What triggers customers to act? i.e. seeing their neighbor installing solar panels, reading about a more efficient solution in the news. By seeing the advanced technology providing a solution for their problem with low cost and getting benefit from where they are, so this makes customers to act.	10. YOUR SOLUTION SL If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour. To clean data and provide visualizations to help doctors in their diagnosis of patient as well as make customers more aware of this issue. Develop an application to predict heart disease with machine learning.	8. CHANNELS of BEHAVIOUR CH ONLINE What kind of actions do customers take online? Extract online channels from #7 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. ONLINE Searching about heart disease symptoms in internet. OFFLINE Asking other people if they feels the same?	Focus on J&P, tap into BE, understand RC
	4. EMOTIONS: BEFORE / AFTER EM How do customers feel when they face a problem or a job and afterwards? i.e. lost, insecure -> confident, in control - use it in your communication strategy & design. When they are facing problem of health illness, they feel lonely depressed of them and their family, feel insecure etc. After knowing their illness can be treated they have hope confidence to tackle their problem.			
Identify strong TR & EM				Identify strong TR & EM

4. REQUIREMENT ANALYSIS

4.1 Functional requirement

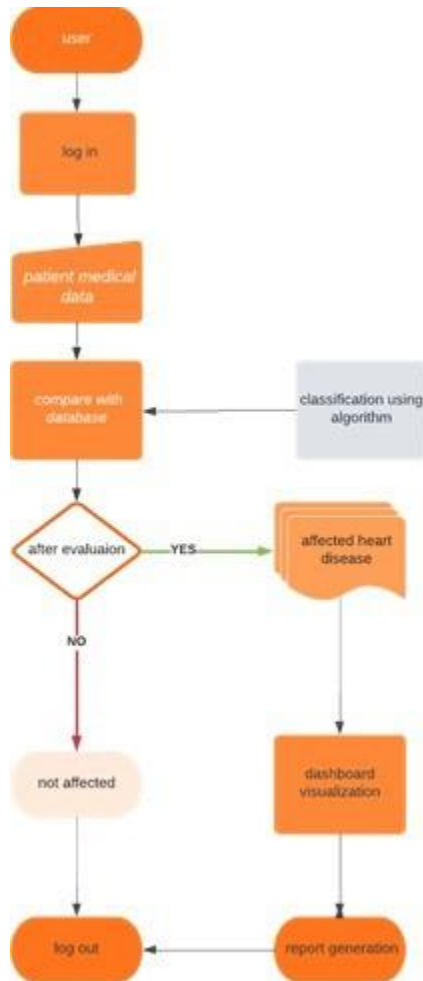

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Enables user to make registration for the application through Gmail
FR-2	User Confirmation	Once after registration, the user will get confirmation via Email
FR-3	Visualizing Data	User can visualize the trends on the heart disease through Dashboard created using IBM Cognos Analytics
FR-4	Generating Report	User can view his/her health report and can make decisions accordingly

4.2 Non-Functional requirements

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The application will have a simple and user- friendly graphical interface. Users will be able to understand and use all the features of the application easily. Any action has to be performed with just a few clicks
NFR-2	Security	For security of the application the technique known as database replication should be used so that all the important data should be kept safe. In case of crash, the system should be able to backup and recover the data
NFR-3	Reliability	The application has to be consistent at every scenario and has to work without failure in any environment
NFR-4	Performance	Performance of the application depends on the response time and the speed of the data submission. The response time of the application is direct and faster which depends on the efficiency of implemented algorithm
NFR-5	Availability	The application has to be available 24 x 7 for users without any interruption
NFR-6	Scalability	The application can withstand the increase in the no. of users and has to be able to develop higher versions

5. PROJECT DESIGN

5.1 Data Flow Diagrams

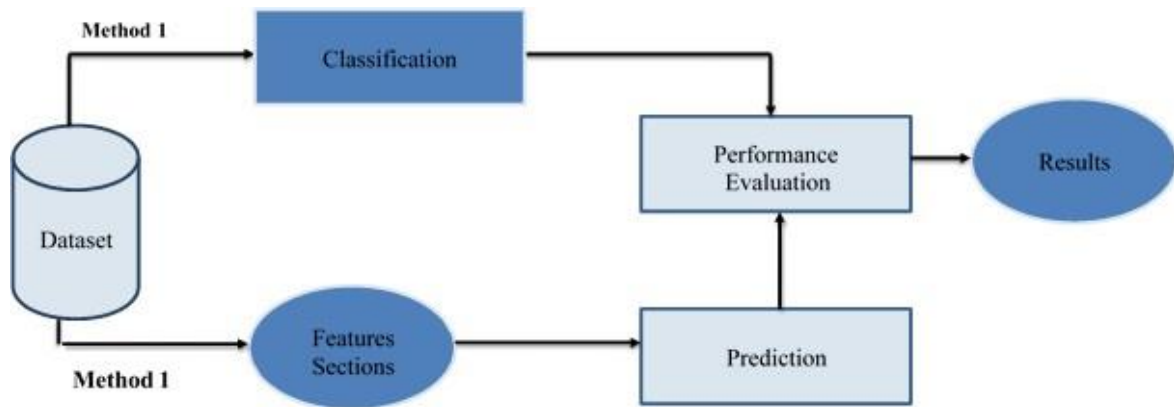

5.2 Solution & Technical

Architecture SOLUTION:

The proposed solution proposes an interactive dashboard for visualising and forecasting heart disorders, in which the user may observe his/her medical report analysis as well as the projected end result. IBM Cognos will be used to create the dashboard. Machine learning Algorithms will be used to forecast cardiac disease.

ARCHITECTURE:

5.3 User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account / dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register for the application through Gmail	I can receive confirmation email	Medium	Sprint-1
Customer (Web user)	Login	USN-4	As a user, I can log into the application by entering email &	I can access my account using my details	High	Sprint-1

			password			
	Dashboard	USN-5	User can view his/her complete medical analysis and accuracy of disease prediction	I can view my medical analysis and accuracy	High	Sprint-2
	Dashboard	USN-6	User can view the accuracy of occurrence of heart disease through report generation	I can view the accuracy of heart disease in the dashboard	high	Sprint-2
Customer Care Executive	Helpdesk	USN-7	As a customer care executive, he/she can view the customer queries.	I can post my queries in the dashboard	Medium	Sprint-3
		USN-8	As a customer care executive, he/she can answer the customer queries	I can get support from helpdesk	High	Sprint-3
User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Administrator	User profile	USN-9	As an admin, he/she can update the health details of users.	I can view my updated health details	High	Sprint-4
		USN-10	As an admin, he/she can add or delete users.	I can access my account / Dashboard when logged in	High	Sprint-4
		USN-11	As an admin, he/she can manage the user details.	I can view the organized data of myself.	High	Sprint-4

6. PROJECT PLANNING & SCHEDULING

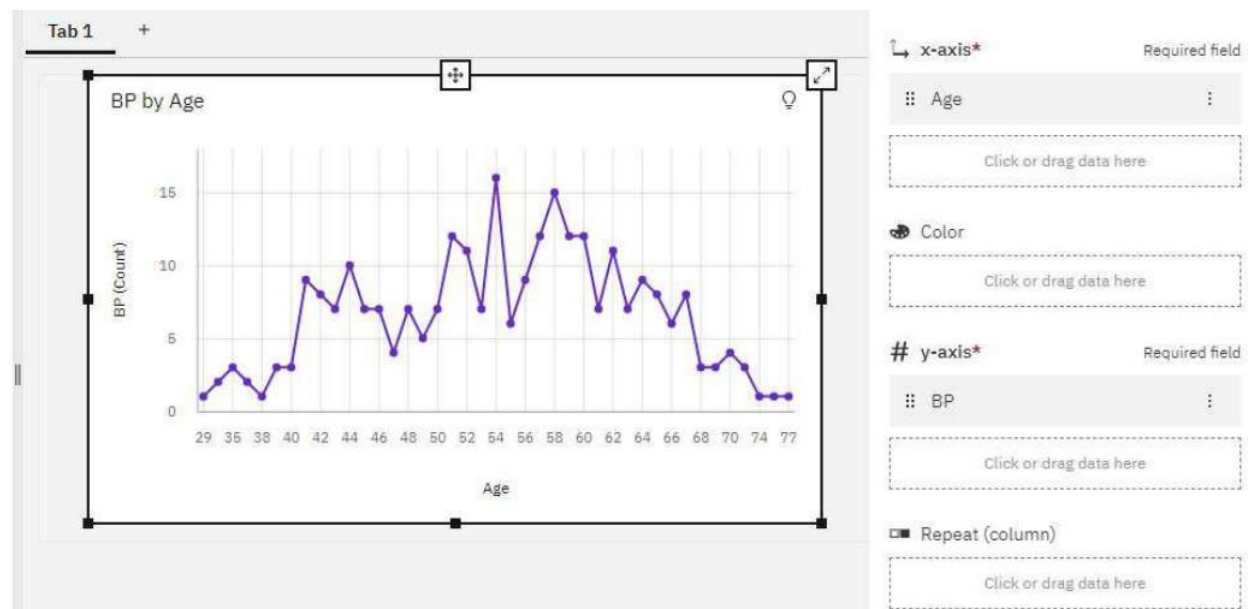

6.1 Sprint Planning & Estimation

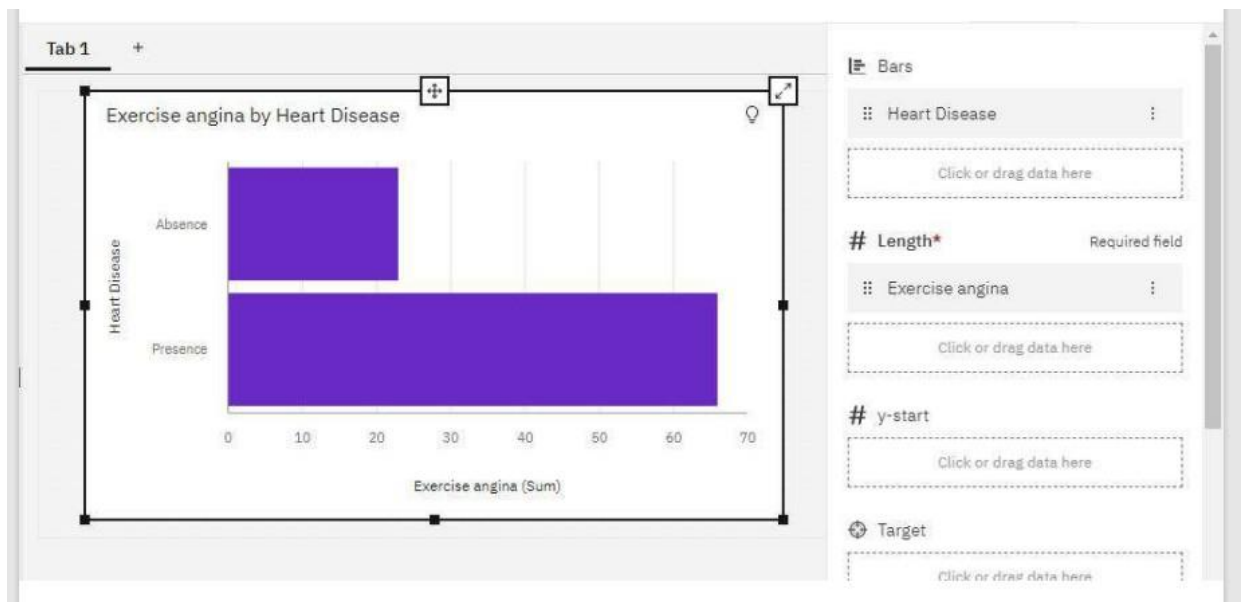

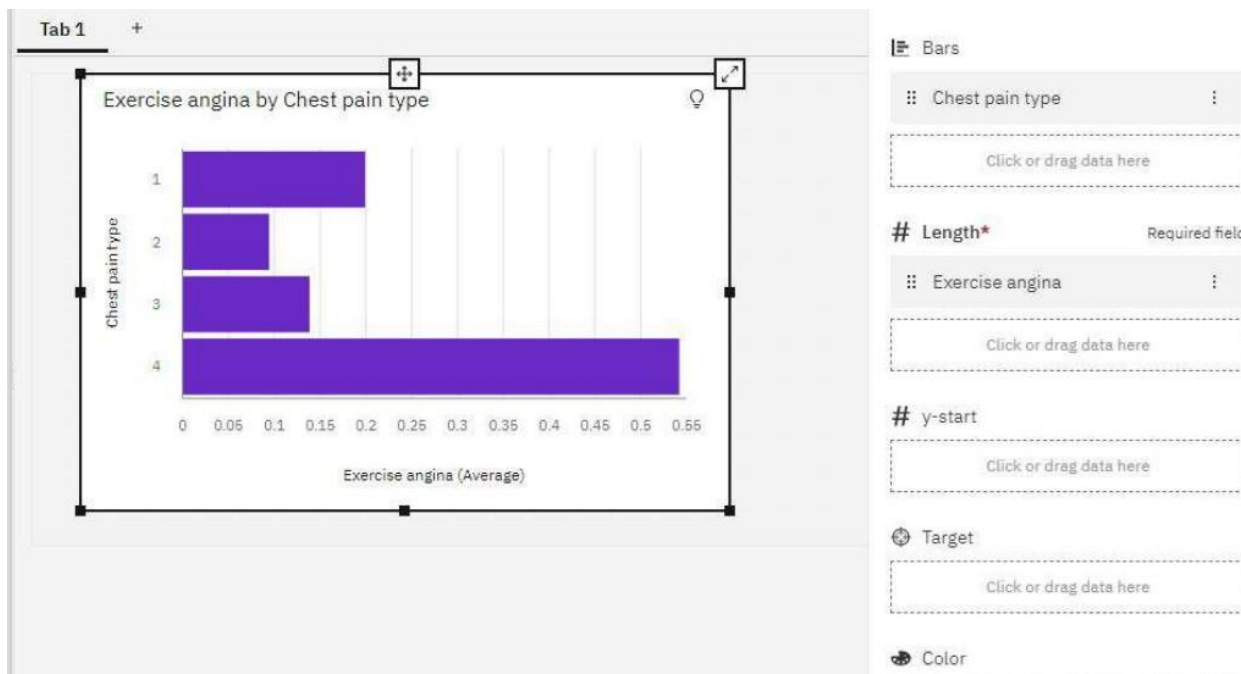

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority
Sprint-1	Registration	USN-1	As a health care provider I can create account in IBM cloud and the data are collected.	20	High
Sprint-2	Analyze	USN-2	As a health care provider all the data that are collected is cleaned and uploaded in the database or IBM cloud.	20	Medium
Sprint-3	Dashboard	USN-3	As a health care provider I can use my account in my dashboard for uploading dataset.	10	Medium
Sprint-3	Visualization	USN-4	As a health care provider I can prepare data for Visualization.	10	High
Sprint-4	Visualization	USN-5	As a health care provider I can present data in my dashboard.	10	High

6.2 Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date(Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

7. CODING & SOLUTIONING (Explain the features added in the project along with code)

7.1 Feature 1

The screenshot shows a data analysis interface with a pivot table titled "Age and Chest pain type for Heart Disease". The pivot table has "Age" and "Chest pain type" as columns and "Absence", "Presence", and "Summary" as rows. The data is as follows:

	Age	Chest pain type
Absence	52.71	423
Presence	56.59	434
Summary	54.43	857

The interface also shows a list of fields on the left, including Age, Sex, Chest pain type, BP, Cholesterol, FBS over 120, EKG results, Max HR, Exercise angina, ST depression, Slope of ST, Number of vessels fluoro, and Thallium. On the right, there are sections for Columns, Rows, # Values*, and Local filters.

8. TESTING

Many different tests are used to diagnose heart disease. Besides blood tests and a chest X-ray, tests data set to diagnose heart disease can include:

- > Electrocardiogram (ECG or EKG).
- > Holter monitoring
- > Echocardiogram
- > Exercise tests or stress tests.
- > Cardiac catheterization.
- Heart (cardiac) magnetic resonance imaging (MRI) scan.

9. RESULTS

The result of the data analysis to identify the necessary hidden patterns for predicting heart diseases are presented in the early stage through this model. Based on the data that are collected from the patients through various tests considered to predict the heart disease are age, chest pain type, blood pressure, blood glucose level. The pre-processed heart disease data set is then composed by K-means algorithm. The aim of this project is to predict heart disease using data mining techniques and machine learning algorithms. The random forest algorithm was used in the study to predict the occurrence of heart disease in patients. A set of important feature scores and rules were identified in diagnosing heart disease and are consulted to confirm the validity of these rules. The experiments performed through the open dataset, widely used for heart disease research yielded the highest confidence score of 98% in predicting heart disease.

10. ADVANTAGES &

DISADVANTAGESADVANTAGES:

As we are using the pre-existing data of the patient or person, it predicts the chances of heart diseases and classifies the patient based on the risk level. Due to this prediction, the patients can consult to the respective doctor as a precautionary measure and can be mental free from the thoughts of their problem

DISADVANTAGES:

Those with heart failure can develop swelling, dizziness, and other symptoms that can affect their ability to complete daily tasks. A person with diagnosed heart disease must also live with the stress of knowing they have a long-term illness that could result in a cardiac event, such as heart attack or stroke. Patients with history of CVD may experience various physical and emotional symptoms such as fatigue, edema, and sleeping difficulties that limit their physical and social activities which will in turn result in poor quality of life.

11. CONCLUSION

With the increasing number of deaths due to heart diseases, it has become mandatory to develop a system to predict heart diseases effectively and accurately. The motivation for the study was to find the most efficient ML algorithm for detection of heart diseases. This study compares the accuracy score of Decision Tree, Logistic Regression, Random Forest and Naive Bayes algorithms for predicting heart disease using UCI machine learning repository dataset. The result of this study indicates that the Random Forest algorithm is the most efficient algorithm with accuracy score of 90.16% for prediction of heart disease. In future the work can be enhanced by developing a web application based on the Random Forest algorithm as well as using a larger dataset as compared to the one used in this analysis which will help to provide better results and help health professionals in predicting the heart disease effectively and efficiently.

12. FUTURE SCOPE

In this work, we are analyzing the data and predicting the risk of heart disease by merely a history or a data set collected from the person. But, if we want to predict the heart disease from this, there may be risks of being prone to one before the prediction. So, we would like to develop or find some algorithm to analyze data that has been streamingly collected from the wearable devices like smart watches, fitness bands, healthcare meters and analyze the data in real time to visualize the condition of the heart to the person.
